

For Loops

15-110 Summer 2010

The for Loop

- Another loop statement, **for**, is best for when you can determine in advance how many times you need to execute the loop (counting loop).
- The **for** statement includes the three parts needed for loops: initialize, test, and update.
 - All this information is conveniently placed at the beginning of the loop.
- All three loop statements (**while**, **do**, and **for**) are functionally equivalent.

The for statement

- The form of the **for** statement is
for (<initialize>; <boolean_expression>; <update>)
 <statement>
- First, the *initialize* statement is executed.
- If *boolean_expression* evaluates to **true**, then *statement* (body of loop) is executed, followed by the *update* statement.
- The loop repeats until the *boolean_expression* evaluates to **false**.

The for statement

- The form of the **for** statement is
for (<initialize>; <boolean_expression>; <update>)
 <statement>
- It is equivalent to

```
<initialize>;  
while (<boolean_expression>) {  
    <statement>  
    <update>;  
}
```

← executed after
statement
(body of loop)

A for Loop Example

```

int sum = 0;
for (int i = 1; i <= n; i++) {
    sum += i*i;
}
System.out.println(sum);
  
```

Which variable is the loop control variable?

n = 4

sum	i
0	
	1
1	
	2
5	
	3
14	
	4
30	
	5

Another for Loop Example

```

int sum = 0;
for (int i = 1; i <= n; i+=3) {
    sum += i;
}
System.out.println(sum);
  
```

n = 11

sum	i

Scope

- The **scope** of a variable is the area within a program that can reference the variable.
- The scope depends on where the variable is declared.

```

int sum = 0;
for (int i = 1; i <= n; i++) {
    sum += i*i;
}
System.out.println(sum);
  
```

Scope of variable **i**

8

Scope

```
int sum = 0;
int i;
for (i = 1; i <= n; i++) {
    sum += i*i;
}
System.out.println("Sum of first " + (i-1)
    + " integers squared is " + sum);
```

Scope of variable *i*

Nested Loops

- A loop can have another loop inside of it.
- For each iteration of the outside loop, the inside loop runs completely.
- Often it is easiest to read from the inside out.
- **Example:**

How many lines are printed?

```
for (int i = 1; i <= 5; i++) {
    for (int j = 1; j <= 3; j++) {
        System.out.println(i + " " + j);
    }
}
```

What happens if we write `println(i + j)`?

Palindromes

- A *palindrome* is word, phrase, or sequence that reads the same backwards as forwards.
- Example: Bob by Weird Al Yankovic
(A parody of Bob Dylan's Subterranean Homesick Blues)

How would you test whether a string is a palindrome?

Which Loops?

- `for` loops are more natural when we know how many iterations we need (*definite* or *counting* loops).

Examples:

- Print "*" 10 times
- Print the even numbers between 10 and the value of *n*

- `while` and `do` loops are more natural when we want to keep looping until some outcome (*indefinite* or *result controlled* loops).

Examples:

- Prompt the user **until** the user inputs the data in the correct form.
- Continue looping **until** we reached a million dollars.
